# The User Dimension of Scientific Impact – conceptualising policy-making conditions for understanding the impact of research upon policy

Jakob Edler  
Maria Karaulova, Kate Barker

Impact of R&I Policy at the Crossroads of Policy Design,  
Implementation and Evaluation Conference  
Vienna 5-6 November 2018

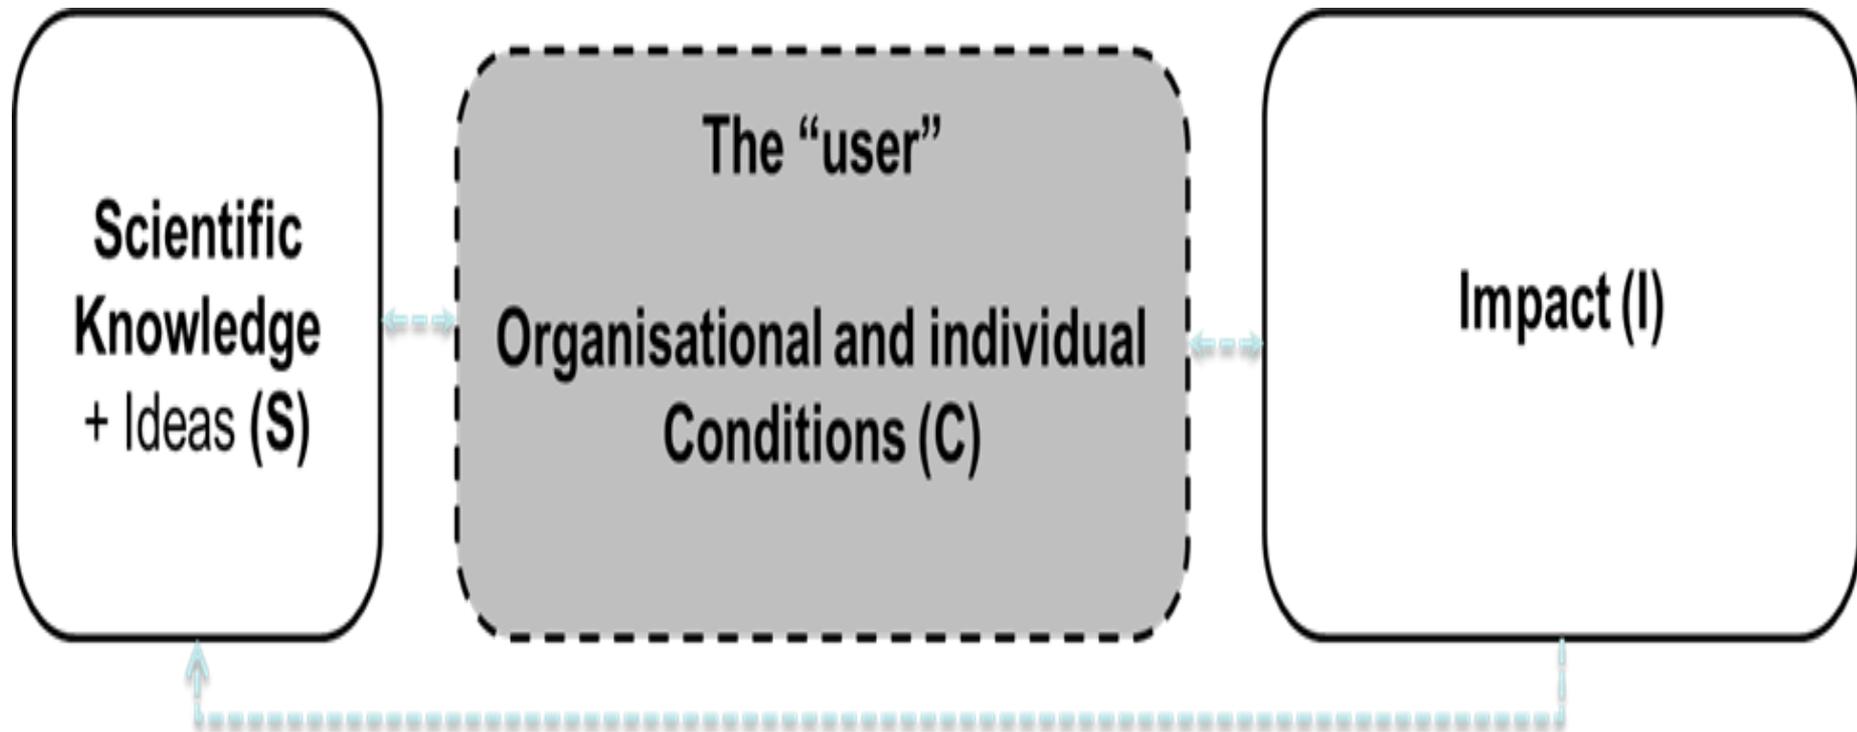

# Background: who is responsible for the impact of scientific research?

---

- Publicly funded research is asked to have high impact on policy, economy and society as a whole
- Increasingly, **evidencing this impact** is important
- The onus is on researchers, universities, institutes to generate impact - when it does not happen, it is their responsibility?  
(collaborative research, adding on dissemination, “users” in advisory panels)

- 
- Focus on **knowledge users** in public policy
    - personal characteristics, institutional conditions
  
  - ...and their **interactions**
    - not a formalistic “dissemination” or heroic “co-generation”  
...while taking note of conditions, behaviour, interaction of  
scientists
  
  - Fill a gap:
    - political science approach where scientific input or experts is one variable
    - science system, scientists and linkage mechanisms are kept (inter-organisational processes)
    - we fully adopt a process perspective on impact (SIAMPI, ASIRPA)

# Our basic Idea S-C-I Framework

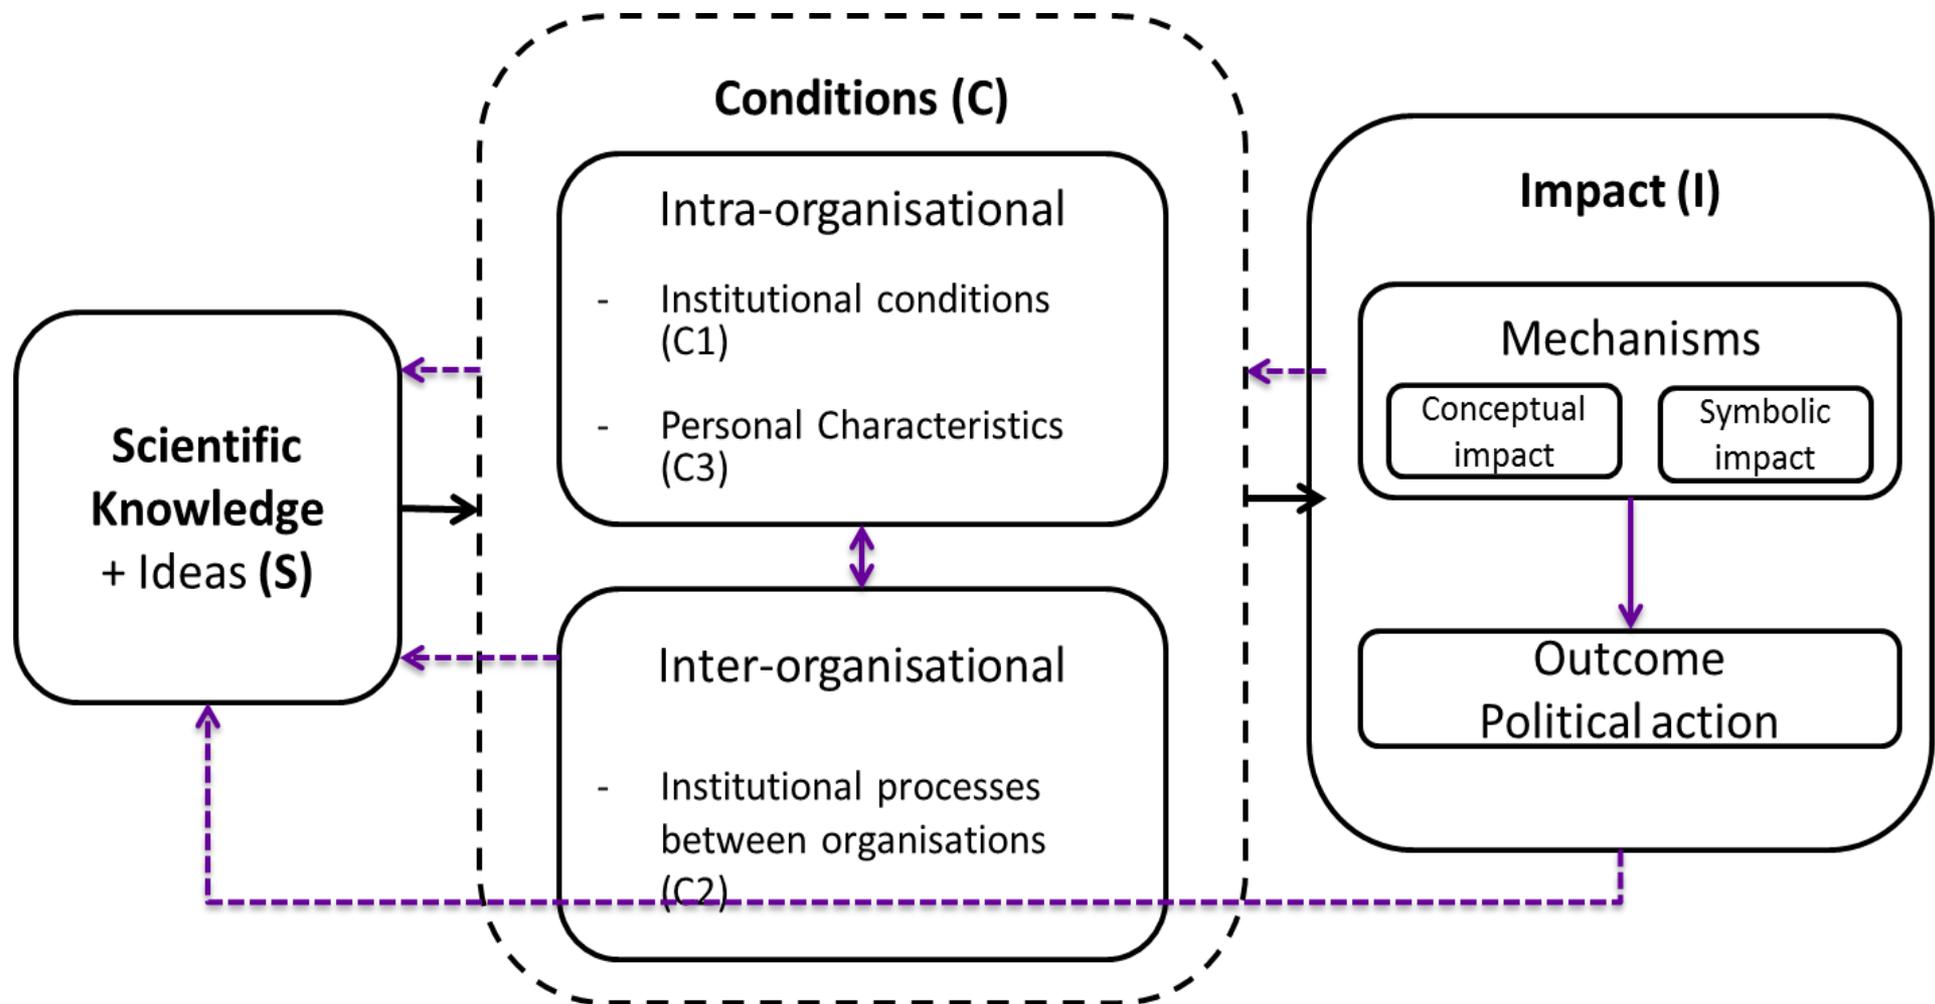

- 
- **Reflexive institutionalism** is an approach from political science that helps explain policy change as a change in cognition, ideas, frames of meaning (Schmidt, 2015; Edler, 2002)
  
  - **Institutional conditions shape identities, motivations, practices and strategies of “users”** (based on Scott 2013)
    - Socio-cognitive: (socially mediated) frames of interpretation, meaning
    - Normative: guiding values, norms, collective processes shaping expectations
    - Regulative: formal rules, incentive structures
  
  - **Conditions found within a ‘user’ policy organisation influence impact**
  
  - **Conditions shape interactions between organisations**

## ■ **Impact: nature**

- Classic definition: conceptual, instrumental and symbolic (Pelz, 1978; Weiss 1999)
- **We propose 2 levels of impact on policy:**
  - Impact on the '**outcome**' of policy process, evidenced in political action
  - Impact on thinking/valuing explaining the **mechanisms** through which the outcome is reached.
    - (i) conceptual
    - (ii) symbolic

- Policy change as result of scientific input
- Nature of normative and cognitive ideas in evidence and their (co-) production
- Nature of discourse and discursive interaction (“producer and user”)
- **Regulative, normative and cognitive** conditions and processes
  - **...within organisations** (search, use)
  - **...of interaction** (e.g. science-policy; or policy-intermediaries)
    - Exchanges and deliberations between science and policy organisations
    - Co-creation of meaning and expectations

*Broader, contextual institutional conditions, role of science in society*

A longitudinal case study in a policy organisation in Greater Manchester (negotiation)

All developed by:

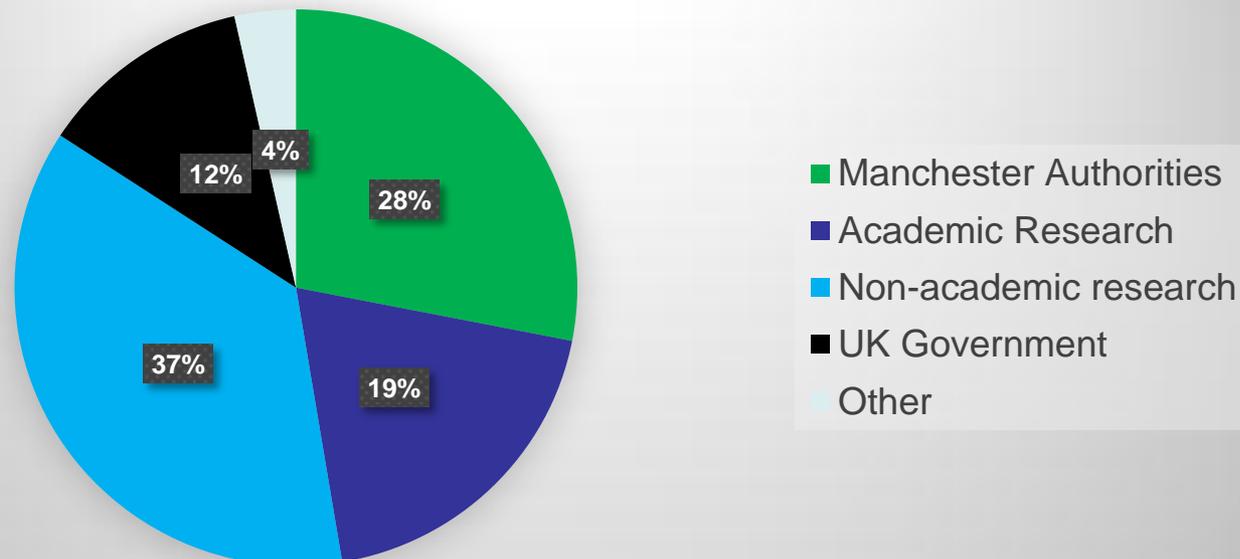

# 2040 Transport Strategy

## Evidence Base

- Extensive use of **data** (local and UK), including geospatial and statistical data
- Draws on a **wide range of sources**
- The role of evidence: mostly to supply data. On rare occasions, normative statements are made based on the evidence.
- Heavily draws on **research conducted or commissioned by the local Manchester authorities** (TfGM, GMCA, consultations and commissioned reports in equal measure)
- 114 total citations to evidence; 22 unique academic citations

### Evidence Citations in the 2040 Transport Strategy

# Scientific Research Influences high level thinking, but is used arbitrarily

**To state a cause-effect relationship or an association between phenomena – usually generic and large-scale, to introduce the topic**

- “Inequality is linked strongly with negative societal impacts”

**To provide evidence from outside the UK**

- Case study on the autonomous traffic management in Singapore; commuters in Norway; bike sharing in Poland

**To argue against a certain viewpoint, or for an unconventional explanation**

- “While organisations like INRIX have observed correlations between increasing congestion and economic growth, academics stress the need to effectively de-couple these two elements...”

**To explain future trends in technology and other innovations worth trying out (pre-selected)**

- “Intelligent and “swarm” robots can work simultaneously towards a single goal due to the utilisation of a “hive mind”, also known as an intelligently connected network.”

**Simply as data to quantify a phenomenon**

**Academic Citations are distributed unevenly in S2040**

Evidence Base Section	Academic Cites
Travel in GM	0%
Economy and Employment	0%
Society and Community	45%
Urban Development	0%
Environment and Resources	5%
Technology and Innovation	50%
Policy and Governance	0%

# What we add...

---

- **We reverse the science biased focus**
- **Allow proper “demand side assessment”** (Sarewitz/Pielke 2007)
- We propose **reflexive institutionalism** taking
  - **content** and
  - **institutional conditions** seriously, at various levels
- We distinguish types of impact, **focus on neglected *conceptual* impact**
- ...and in doing so might better understand (lack of) **instrumental impact**

# Thank you!

---
